

The security software-as-a-service experts

Extensible Service Platform for Enterprise

▶ Single-Point Management

▶ Best of Breed Applications

▶ Instant Deployment

ESP Enterprise supports a wide range of integrated end-point security modules from leading vendors, and is updated with additional modules regularly...

- Purchase, deploy, and manage all of your security solutions from an integrated, intuitive console.
- Live statistics and performance summary gives the administrator a birds-eye view of security operations.
- "Hot-swap" end-point security modules from leading technology & threat database developers to ensure optimum performance and preserve control at all times.

The ESP Enterprise security software-as-a-service platform enables telecom carriers, systems integrators and Managed Security Service Providers (MSSPs) to design and build private-label security solutions, end-point suites and web portals, based on market-leading, enterprise-class brands and applications.

The Authentium ESP Enterprise Platform includes enterprise-class virus protection, anti-spyware, data recovery, personal firewall, content controls, and transaction security modules. All applications are brand-able and easily translatable, using Authentium ESP Architect. Proprietary security applications and web services are easily added using the ESP SDK.

With ESP Enterprise, our partners can extend their services, enhance their value, and create significant recurring revenue opportunities. Only Authentium can provide a complete, customizable solution for client security management under your brand.

Authentium's ESP Enterprise security management platform enables Managed Security Service Providers (MSSPs) and ISPs to increase recurring revenues by protecting businesses, education, and government agency computer systems from malware, targeted attacks, legal liabilities, and policy noncompliance, using a combination of integrated best of breed technologies.

ESP Enterprise enables new revenue streams

Telecommunications companies and other service providers, including large systems integrators, are under growing pressure from customers to provide increased service levels, and from shareholders to increase revenues. ESP Enterprise enables service providers to deliver best of breed security solutions to their business, education and government customers from multiple vendors under their own brand. ESP solutions scale from the smallest organizations up to organizations totaling hundreds of thousands of end-points, enabling businesses to grow revenues across their entire customer base, and increase service levels and reliability relative to competitors.

ESP Enterprise supports best of breed purchasing

Network administrators prefer to deploy best of breed security by a 3-1 margin over "single vendor" approaches (Forrester). Prior to the release of Authentium ESP Enterprise, network administrators choosing to deploy software from multiple vendors ran a high risk of encountering serious technology conflicts, ranging from "blue screens" to resource conflicts and performance issues. Authentium ESP enables network administrators to deploy best of breed technologies using an integrated resource and policy management framework that includes integrated application testing, reporting, updating, and procurement, plus unified support and license management.

ESP Enterprise has many advantages over traditional security software products

Authentium ESP enables purchasers to choose which technologies they wish to deploy from a range of best of breed developers. Authentium's dynamic, multi-vendor framework enables network administrators to uninstall technologies or swap technology vendors at any time, based on price, performance, brand preference, or any other factor—a degree of flexibility unmatched by Symantec, McAfee, or any other!

Powerful distribution model

Authentium's distribution partners maintain billing and service relationships far stronger than relationships typically maintained by software companies. The ESP model enables Authentium and our partners to leverage existing service-based infrastructures and support an unlimited number of business users.

Authentium's customization, flexibility, and targeted support capabilities are unique

Authentium has developed a unique, customizable suite of security software services that enable our partners to leverage their customer relationships and trusted brands; begin building service-based distribution businesses that will generate recurring revenue opportunities. The ESP SDK enables MSSPs to write and deploy their own applications. All aspects of the service are customizable, brand-able and extensible, including support, billing, and relationship management.

Authentium ESP supports every kind of purchasing decision: performance, price, brand

Authentium ESP enables purchasers of network security products and services to purchase from multiple vendors, based on price, performance, or brand—and reverse the purchasing decision in favor of an alternate vendor at any time, with the full support of Authentium and our distribution partners. This level of flexibility allows network administrators to quickly and easily deploy solutions based on the most ideal combination of preferences, and to effectively deal with cost/performance and policy compliance issues, without having to change vendors — an industry first.
